1. SPECIFICATIONS

ITEM	MODEL	RAV-160KH-P
Cooling capacity	*1 kcal/h	4,000
	BTU/h	16,000
	kW	4.7
Heating capacity	*2 kcal/h	4,300
	BTU/h	17,200
	kW	5.0
Power source	Phase	1
	V	220 - 240
	Hz	50
Power consumption	kW	COOLING 2.3 HEATING 2.2
Power factor	%	90
Running current	A	11.1
Starting current	A	60
Operating noise (SPL)	Indoor unit	45/40/38
	Outdoor unit	50
Refrigerant	Name of refrigerant	R-22
	Charge volume	kg 1.6
	Add. volume (20-30m)	g/m 35
Refrigerant control		Capillary tube & Expansion valve
Interconnection pipe	Larger side size	mm (in.) ϕ 12.7 (1/2")
	Coupler style	Flare
	Smaller side size	mm (in.) ϕ 6.4 (1/4")
	Coupler style	Flare
	Standard length	m (ft) 5.0 (16'4")
	Maximum length (of one way) *3	m (ft) 30 (98'4")
	Maximum height	
	Indoor unit higher	m (ft) 15 (49')
	Outdoor unit higher	m (ft) 30 (98'4")
Condensate drain pipe diameter	mm	ϕ 20 (ID)
INDOOR UNIT Model		RAV-160KH-P
Appearance colour		Silky white
Dimensions	Height	mm (ft-in.) 370 (1'2-9/16")
	Width	mm (ft-in.) 1,020 (3'4-3/16")
	Depth	mm (ft-in.) 200 (7-7/8")
Net weight	kg (lbs)	19 (42)
Heat exchanger type		Finned tube
Indoor fan type		Transverse flow fan
Air volume	m ³ /h (CFM)	780 (459)
Fan motor output	W	27
Air filter		Washable
OUTDOOR UNIT Model		RAV-161AH-P
Appearance colour		Bronze white (Munsell 6Y7.5/1)
Dimensions	Height	mm (ft-in.) 740 (2'5-1/8")
	Width	mm (ft-in.) 880 (2'10-5/8")
	Depth	mm (ft-in.) 310 (1'3/16")
Net weight	kg (lbs)	61 (134)
Heat exchanger type		Finned tube
Outdoor fan type		Propeller fan
Fan motor output	W	39
Compressor	Model	PH250X3-4LS
	Output	kW 2.0
Protective device		High pressure switch, Fuse, Crankcase heater, Overload relay, Bimetal thermostat

Specifications are subject to change without notice.

Note 1: Cooling capacity is based on the following temperature conditions.

Indoor air inlet temperature: 27°C DB (80°F DB)
19.5°C WB (67°F WB)
Outdoor air inlet temperature: 35°C DB (95°F DB)

Note 2: Heating capacity is based on the following temperature conditions.

Indoor air inlet temperature: 21°C DB (70°F DB)
Outdoor air inlet temperature: 7°C DB (45°F DB)
6°C WB (43°F WB)

Note 3: These mean actual length.

Note 4: Operating range of the units

Indoor air temperature
When cooling
Maximum 32°C DB, 22.5°C WB (90°F DB, 73°F WB)
Minimum 18°C DB, 15.5°C WB (65°F DB, 60°F WB)
When heating
Maximum 29°C DB (84°F DB)
Minimum 15°C DB (59°F DB)
Outdoor air temperature
When cooling
Maximum 43°C DB, 25.5°C WB (109°F DB, 78°F WB)
Minimum 0°C DB (32°F DB)
When heating
Maximum 21°C DB, 15.5°C WB (70°F DB, 60°F WB)
Minimum -10°C WB (14°F WB)

Note 1: Cooling capacity is based on the following temperature conditions.

Indoor air inlet temperature: 27°C DB (80°F DB)
19.5°C WB (67°F WB)
Outdoor air inlet temperature: 35°C DB (95°F DB)

Note 2: Heating capacity is based on the following temperature conditions.

Indoor air inlet temperature: 21°C DB (70°F DB)
Outdoor air inlet temperature: 7°C DB (45°F DB)
6°C WB (43°F WB)

Note 3: These mean actual length.

Note 4: Operating range of the units

Indoor air temperature

When cooling

Maximum 32°C DB, 22.5°C WB (90°F DB, 73°F WB)
Minimum 18°C DB, 15.5°C WB (65°F DB, 60°F WB)

When heating

Maximum 29°C DB (84°F DB)
Minimum 15°C DB (59°F DB)

Outdoor air temperature

When cooling

Maximum 43°C DB, 25.5°C WB (109°F DB, 78°F WB)
Minimum 0°C DB (32°F DB)

When heating

Maximum 21°C DB, 15.5°C WB (70°F DB, 60°F WB)
Minimum -10°C WB (14°F WB)

6. REMOTE CONTROLLER

6.1 Remote controller

BUTTON	INDICATOR		OPERATION
ON/OFF		LED (RED)	Run/Stop
MODE SELECT	MODE	AUTO COOL HEAT 1 HEAT 2 FAN ONLY	Auto Changeover Cooling Heating Heating (with indoor fan operation at defrost) Fan only
FAN SELECT	FAN	AUTO LOW MED HIGH	Auto Fan Speed Control Low Fan Speed Med. Fan Speed High Fan Speed
TEMP. CONTROL	TEMP.	88 °C °F	Temperature setting
TIME ADJUST	TIME	(1) CLOCK (2) ON TIME (3) OFF TIME 88:88	(1) Present Time Adjust (2) ON Time Setting (3) OFF Time Setting
TIMER SELECT	TIMER	ON OFF ON → OFF ON ← OFF CYCLE	ON Timer OFF Timer ON → OFF Timer OFF → ON Timer 24H Cycle Timer

6.2 Outline of remote controller's functions

NO.	KEY SWITCH	OUTLINE OF SPECIFICATIONS	REMARKS
1	[ON/OFF]	① When this button is pushed once, the air conditioner is turned on, with the operation lamp coming on. ② If pushed once more, it will be turned off, the operation lamp going off. ③ If pushed for 5 sec. in the mode of turning on the air conditioner, goes into test run mode.	Fan only after 30 min.
2	MODE SELECT	① Each time this button is pushed, the [MODE] setting is changed over cyclically, [AUTO] → [COOL] → [HEAT1] → [HEAT2] → [FAN ONLY] → [AUTO]. ② If pushed continuously, the setting will be changed in one step every 0.5 sec.	
3	FAN SELECT	① Each time this button is pushed, the [FAN] setting is changed over cyclically, [AUTO] → [LOW] → [MED] → [HIGH] → [AUTO]. ② If pushed continuously, the setting will be changed in one step every 0.5 sec.	Fan speed
4	TEMP. CONTROL 	① Each time [+] this button is pushed, the [TEMP] setting of temperature is raised by 1°C. ② If [+] is pushed continuously, the setting will be raised by 1°C every 0.5 sec. ③ Each time [-] button is pushed, the setting of temperature is lowered by 1°C. ④ If [-] is pushed continuously, the setting will be lowered by 1°C every 0.5 sec.	In the 18~29° Control range
5	TIME CONTROL 	① Each time [TIME ADJUST] button is pushed, the [TIME] display is changed cyclically. The time can be changed while the TIME display stays flashing. (flashing) (flashing) (flashing) [CLOCK] → [CLOCK] → [ON TIME] → [OFF TIME] [12:00] [12:00] [6:00] [18:00] ② While the TIME display stays flashing, the time gains one minute upon each pressing of [+]. ③ If [+] is pushed continuously, the time gains 10 minutes every 0.25 sec. ④ While the TIME display stays flashing, the time goes back one minute upon each pressing of [-]. ⑤ If [-] is pushed continuously, the time goes back 10 minutes every 0.25 sec. ⑥ Each time [TIMER SELECT] button is pushed, timer mode change over cyclically, [] (CONTINUE) → [ON] → [OFF] → [ON→OFF] → [ON←OFF] → [CYCLE] → []. ⑦ If pushed continuously, the timer mode will be changed in one stop every 0.5 sec.	If time is not set, 12:00 6:00 18:00 are set automatically.
6	CHECK	① Pressing this key for 0.5 sec. provides [MALFUNCTION CHECK], indicating on liquid crystal the contents of inspection in the sequence of (times of compressor-on) → (contents of malfunction for #1 unit) → (contents of malfunction for #2 unit) →.... ② Pressing this key for 5 sec. gives "Indoor microcomputer reset mode" to reset the indoor microcomputer by way of hardware. ③ Pressing this key for 10 sec. gives "Check contents clear mode" to clear the contents of inspection stored in the remote controller provided, however, times of compressor-on is not cleared.	The indication of the indoor unit which has not any malfunction content is skipped.
7	Reset	① By pressing the reset key, the remote controller is reset by way of hardware. (The setting/display are in initial values with the check memory cleared.)	

6.3 Timer operation

Continuous operation and timer operations are available. The setting of timer operation can be done as follows:
ON, OFF, ON → OFF, OFF → ON, ON ↔ OFF CYCLE.

6.3.1 Time display

The present time is always displayed

The display of the ON/OFF time is only in setting the time.

Once set, it will not be changed even after carrying out the timer operation until the timer is reset.

Initial set time	The present time	12:00
	The time of ON	6:00
	The time of OFF	18:00

6.3.2 How to set the time

Liquid crystal

As to (-) and (+), change takes place by one minute by pressing once and 10 min./0.25 sec. by pressing continuously.

How to set the present time

[TIME ADJUST] switch is pressed.
[CLOCK] and Time figures flash.

- 2) Time is set by Time setting switch (-) or (+). The setting is finished when releasing. Pressing [TIME ADJUST] three times gives the display of the present time.

(If left as it is, after 15 sec. the display will go back to the present time).

How to set ON TIME

[TIME ADJUST] switch is pressed twice.
[ON TIME] and Time figures flash.

- 2) Time is set by Time setting switch (-) or (+). The setting is finished when releasing. Pressing [TIME ADJUST] twice gives the display of the present time.

(If left as it is, after 15 sec. the display will go back to the present time).

How to set OFF TIME

[TIME ADJUST] switch is pressed three times.
[OFF TIME] and Time figures flash.

- 2) Time is set by Time setting switch (-) or (+). The setting is finished when releasing. Pressing [TIME ADJUST] twice gives the display of the present time.

(If left as it is, after 15 sec. the display will go back to the present time).

6.3.3 How to set the timer operation

The following can be chosen sequentially by pressing [TIMER SELECT] switch:

- 1) [TIMER] ON
- 2) [TIMER] OFF
- 3) [TIMER] ON → OFF
- 4) [TIMER] ON ← OFF
- 5) [TIMER] CYCLE

* Be sure to set the present time.

* In case of reoperating after finishing timer operation, if [TIMER SELECT] is not altered, the timer operation will be performed again.

Timer ON operation

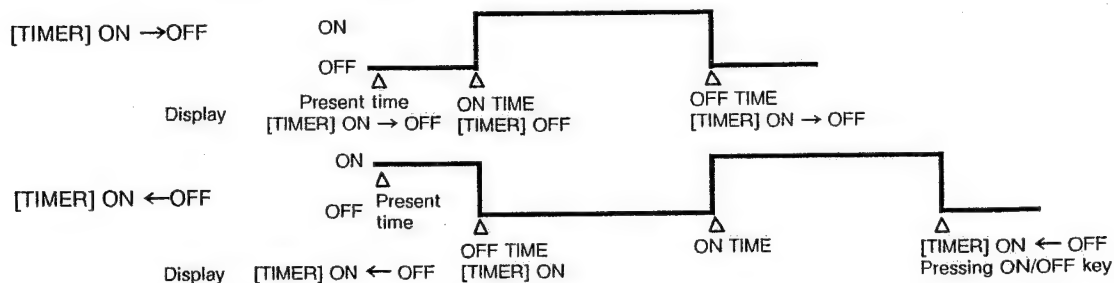

- 1) [TIMER] ON is applied.
- 2) ON/OFF key is pressed. Then LED is lighted.
When the set [ON TIME] comes, the operation starts and OPERATION display comes on the liquid crystal, and the [TIMER] ON display goes off.
- 3) LED and OPERATION display goes off upon pressing ON/OFF key for stopping and [TIMER] ON is displayed.

Timer OFF operation

- 1) [TIMER] OFF is applied.
- 2) ON/OFF key is pressed. Then LED is lighted and the operation starts with OPERATION displayed on the liquid crystal.
- 3) When the set [OFF TIME] comes, the operation stops and the LED, OPERATION display goes off with [TIMER] OFF displayed.

ON ↔ OFF timer operation

- 1) [TIMER] ON → OFF or [TIMER] ON ← OFF is applied.
- 2) ON/OFF key is pressed. LED comes on and the operation is performed as below:

Repeated operation

- 1) [TIMER] CYCLE is applied.
- 2) ON/OFF key is pressed. Then LED is lighted and ON ↔ OFF timer operation is repeated according to the ON time and OFF time (repeating every day as it is a 24-hour timer).
- 3) The operation key is pressed. LED goes off and operation stops.

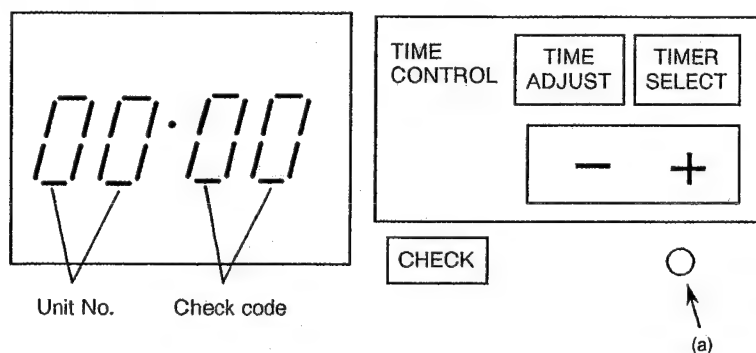

Timer stand-by display and operation display

Waiting on the timer is displayed by LED lighting while the actual operation is displayed on OPERATION on liquid crystal.

6.4 Malfunction check monitor

6.4.1 The times of thermostat ON as well as the check code are displayed on the time display area by pressing CHECK key.

[CHECK] switch

Provides check code display by pressing for one second and indoor microcomputer reset by pressing for 5 seconds.

- * Remote controller clear by pressing the key for 10 sec. Check code is cleared (normally not used).
- (a) Reset key (pushed by a needle and the like) Resetting remote controller (to the initial setting)

Judgement from operation status

	OPERATION STATUS	CODE	CAUSE
1.	Compressor stays off in cooling: it is not turned off in heating.	0C	Open-circuit in room temperature sensor.
	Compressor stays off in heating: it is not turned off in cooling.		Short-circuit in room temperature sensor.
2.	Indoor fan stays off in heating.	0d	Open-circuit in indoor heat-exchanger sensor.
	Outdoor fan continues ON-OFF operation in heating.		Short-circuit in indoor heat-exchanger sensor.
3.	Though indoor unit operates, outdoor unit remains off.	04	Abnormality in connecting cable between indoor and outdoor units.
4.	Indoor fan does not work in heating operation. Warm air comes out in cooling operation.	08	4-way valve coil burnt out, pipe clogged, abnormality in indoor heat-exchanger sensor.
5.	Indoor fan at LOW speed in cooling operation with the outdoor remaining in stoppage.	09	Refrigerant gas in shortage. Abnormality in indoor heat-exchanger sensor.
6.	Full stop	18	Open or short-circuit in outdoor TE sensor.
7.	Full stop	19	Open or short-circuit in outdoor TL sensor.
8.	Full stop	21	Pressure switch does not reset within the set time.
9.	Indoor unit does not operate at all.	99	Abnormality in connecting cable between remote controller and indoor units.
10. *	Though indoor unit operates, outdoor unit remains off.	0b	Abnormality in drain system. Fault of drain pump. Drain pipe clogged.

* With drain pump units only

Note: If the red LED on the remote controller does not flash when the system is switched on, then the wiring to the outdoor unit needs to be checked to ensure that the three phases are wired in the correct sequence. (RAV-261AH8 unit only.)

6.4.2 How to read malfunction check monitor display

By pressing [CHECK] key, times of No.1 unit compressor-ON actuations as well as the check code information of 2 faults × 16 units are displayed on the time display area. (2 sec. per one phenomenon)

<Times of compressor-ON>

Display in 4 digits of hexadecimal notation

Display in 7 segments

Ex. In case of the number of times of compressor actuations of 164.

$$16^3 \times 0 + 16^2 \times 0 + 16 \times 10 + 4 = 164$$

<Check code information>

No display is made if there is no fault.

Ex. In case of room temperature sensor of No.1 unit in trouble.

For No.15 unit, firstly heat exchanger temperature sensor and secondly float switch circuit are faulty.

6.4.3 List of Check Code

DIAGNOSTIC FUNCTIONS			JUDGEMENT AND ACTION
CHECK CODE	SYMPTOM	STATUS OF AIR CONDITIONER	
01	<div>ROOM TEMP. SENSOR (TA).</div> <p>Out of place, break, short-circuit.</p>	Operation continuing	<ol style="list-style-type: none"> 1. Check for indoor temp. sensor. 2. Check for indoor PC board.
02	<div>INDOOR HEAT-EXCHANGER SENSOR (TC).</div> <p>Out of place, break, short-circuit.</p>	Operation continuing	<ol style="list-style-type: none"> 1. Check for indoor heat-exchanger sensor. 2. Check for indoor PC board.
04	<div>RETURN SIGNAL NOT COMING TO INDOOR</div> <p>1) Wrong wiring in connecting cable (serial signal).</p>	Operation continuing	<ol style="list-style-type: none"> 1. 8. DESCRIPTION OF INDOOR UNIT CONTROL CIRCUIT

8.1 Serial signal circuit (between outdoor and indoor units)

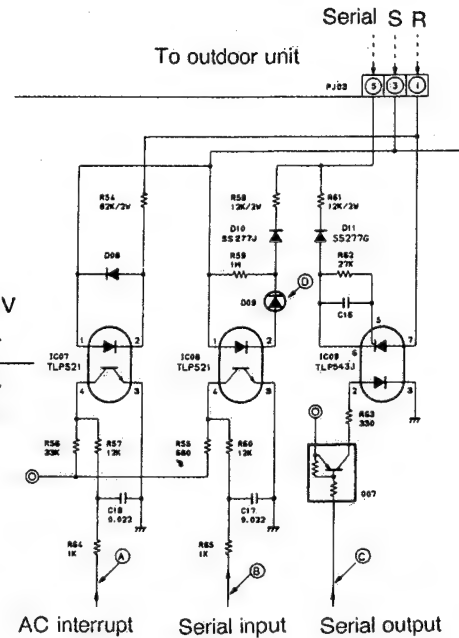

This is a circuit for transmitting and receiving the signals between the indoor and outdoor units in serial signal. As 230V is used for transmitting the signal, the microcomputer section is insulated by means of photo-coupler with the voltage reduced to 5V.

With AC interrupt, judgement is made as to the presence or absence of serial signal based on the reference pulse taken out from the voltage across R and S.

Ⓐ/Ⓑ are measurement points on the printed circuit board.

Ⓓ provides flashing (orange) on LED in the serial input.

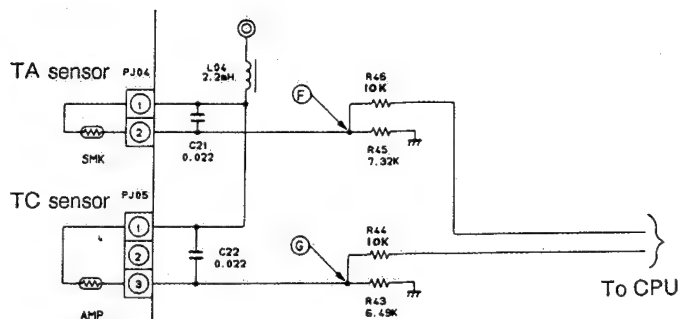

8.2 Float switch circuit

In normal condition in which float switch is not operated, 230V is applied across the pins 1 and 2. At this time, point Ⓔ is at the GND level. If the float switch is operated, Ⓔ will be at the level of 5V.

8.3 Sensor circuit

This circuit detects the temperature by dividing voltage with resistance and sensor and bringing the voltage value into CPU, using the characteristics of the sensor that resistance varies with different temperatures. TA and TC have the same circuit composition.

When TA and TC are at 25°C approximately, the voltage level is some 2V both at points (F) and (G). If (F) / (G) are at GND or 5V, abnormal condition prevails such as opening or short-circuit of the sensor.

8.4 12V power source circuit

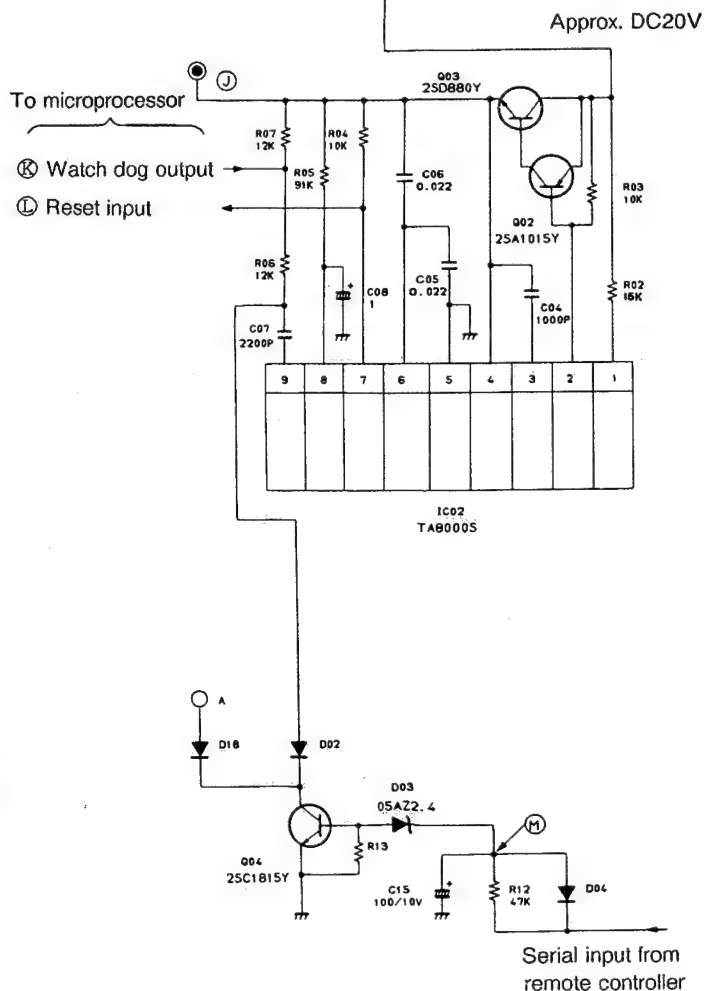

Full-wave rectification by diode bridge (DB01) of alternate current supplied from power transformer followed by the provision of transistor (Q01) gives DC12V power source (H).

8.5 5V watchdog timer circuit

Built-in IC (TA8000S) is used to produce 5V power source (I). Also, it sends signals to reset port (L) of microcomputer which is in stand-by at 0V and starts its operation with the signal of 5V.

Watchdog timer output (K) gives the signal from microcomputer as illustrated below. This indicates that the microcomputer is working in normal routine. For example if the microcomputer is straying due to noise and so on, this waveform is not produced. In case there is no waveform, it plays the role of restoring normal condition by inputting the resetting "0V" to the microcomputer.

8.6 Reset circuit

This circuit makes indoor microcomputer reset by way of hardware when you keeps on pressing the check key of remote controller for longer than a predetermined period. It plays the role of resetting microcomputer from the remote controller when it strays. The point (M), which is normally at the level of 5V, drops down to the GND level in the reset operation.

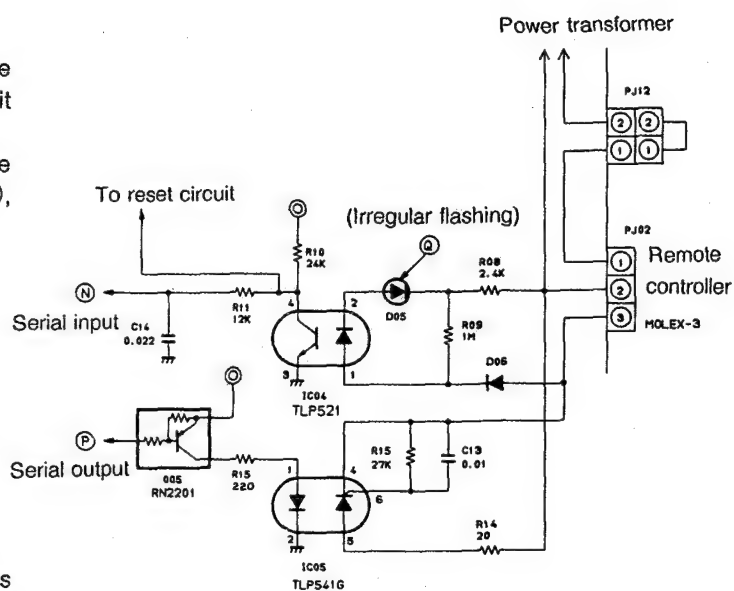

8.7 Serial signal circuit

(Between remote controller and indoor unit)

This is the circuit for transmitting and receiving the signals between the remote controller and indoor unit in serial signal.

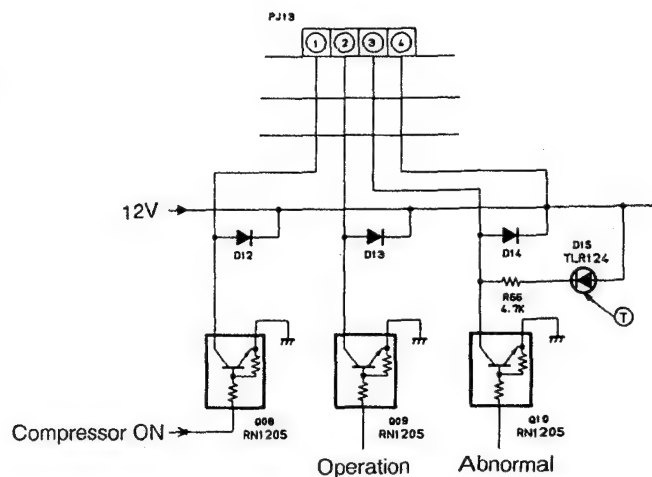

Point ① is a LED (green) which flashes when there are signals from the remote controller. At ② and ③, the signals as illustrated below are output.

8.8 Optional circuit

A circuit which allows for the take-out of the signals of abnormal, operation and Compressor-ON. Point ① is a LED which lights at abnormal.

The connector pin 1 outputs 12V. When you want to see the signal of compressor-ON, you can do it simply with the circuit below.

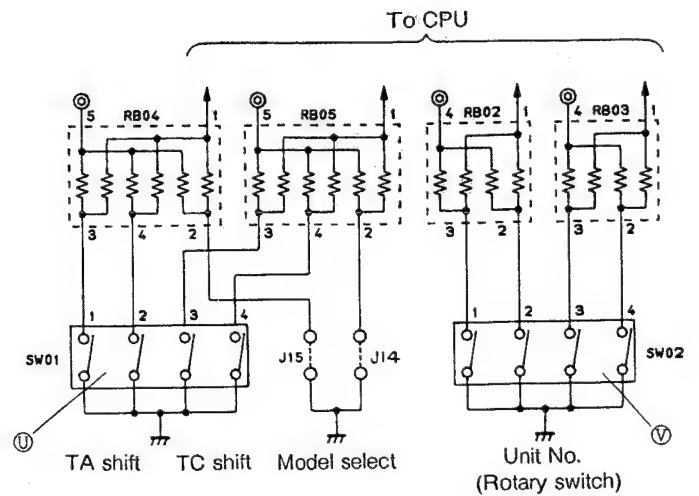

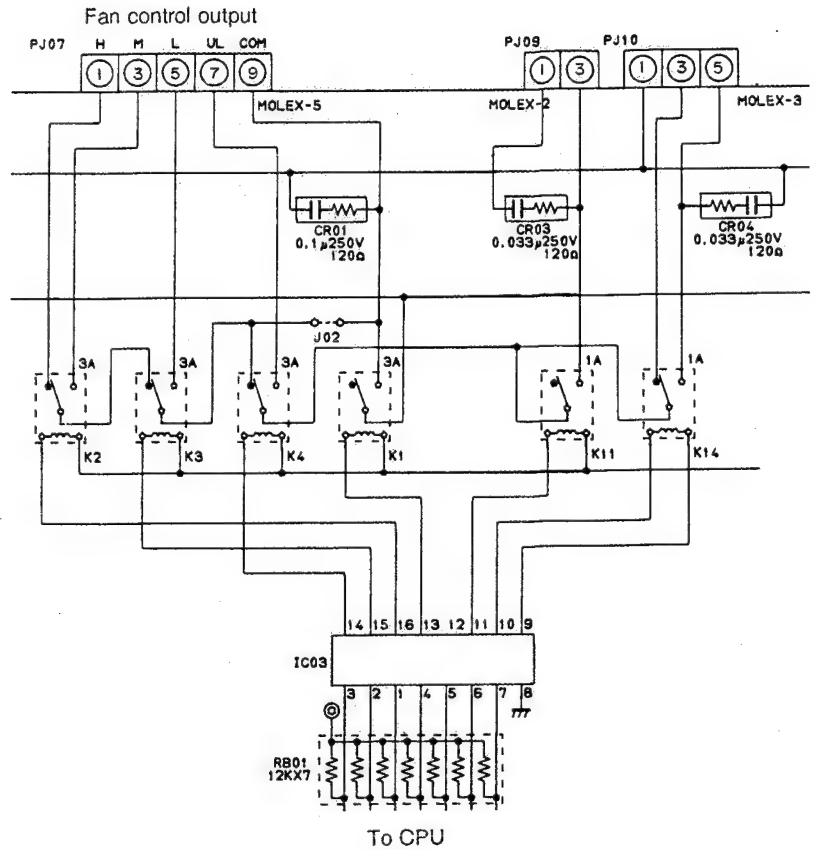

8.9 Relay circuit

The relay circuit consists of the diagram in the righthand side.

The relay performs the following functions:

- K1: Turning fan on and off
 - K2: Changing over H/M of fan
 - K3: L tap of fan
 - K4: UL tap of fan
 - K11: Turning louver on and off
 - K14: Turning drain pump on and off
- (① - ③)

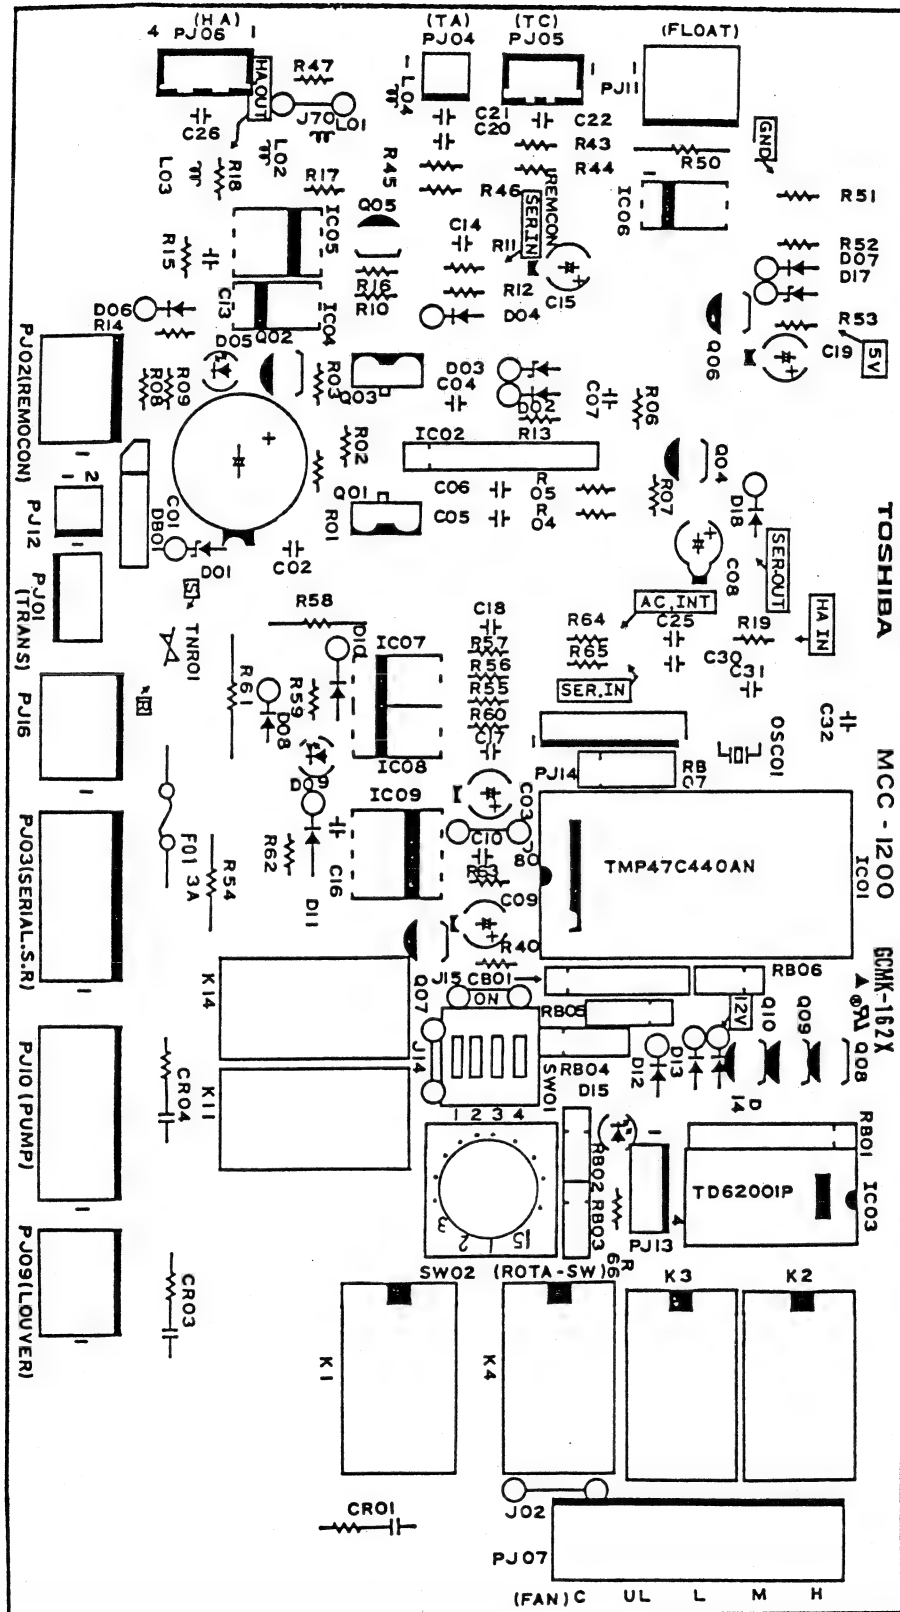

8.10 Switch circuit

TA shift, TC shift and unit No. are changed over by the switch.

TA shift and TC shift are set in factory with unit No. at "1".

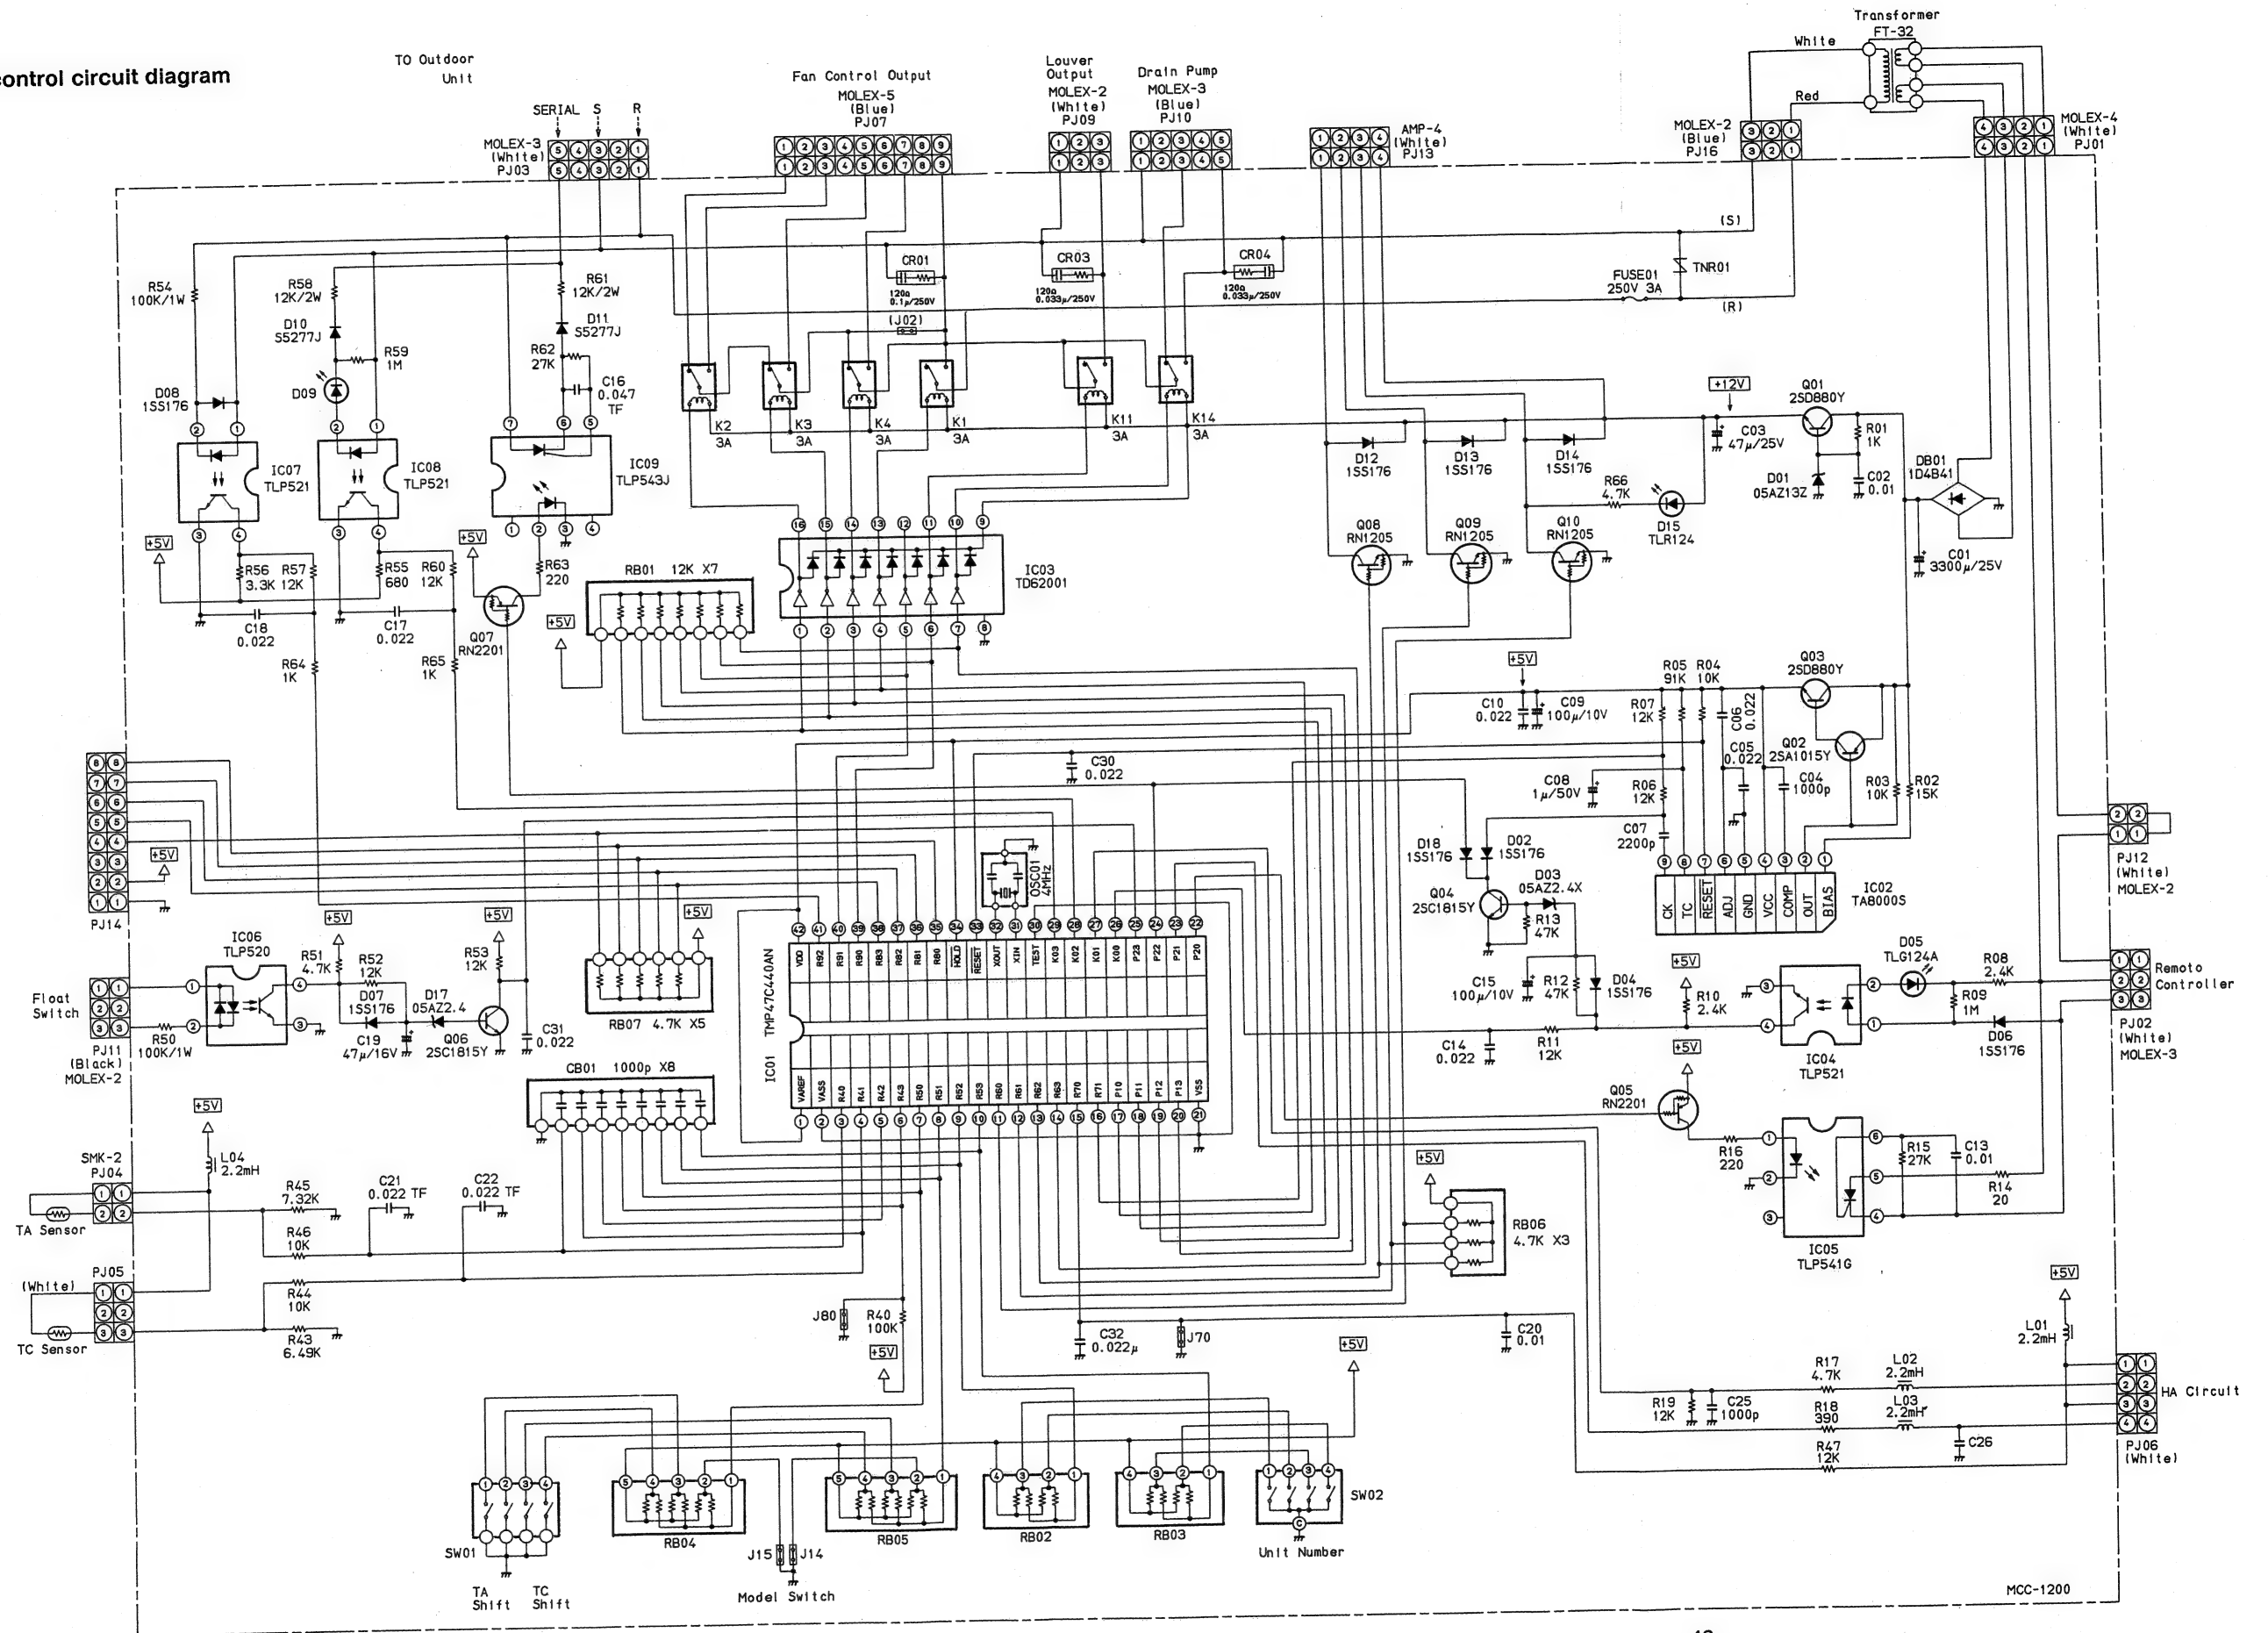

In servicing, the setting should be made to the same TA/TC shift as the PC board attached originally. In case of operating one single unit, unit No. "1" will do. With the operation of many units (multi units control) the unit No. should be adjusted in such a way as 1, 2, 3

8.11 Indoor unit PC board

8.12 Indoor unit control circuit diagram

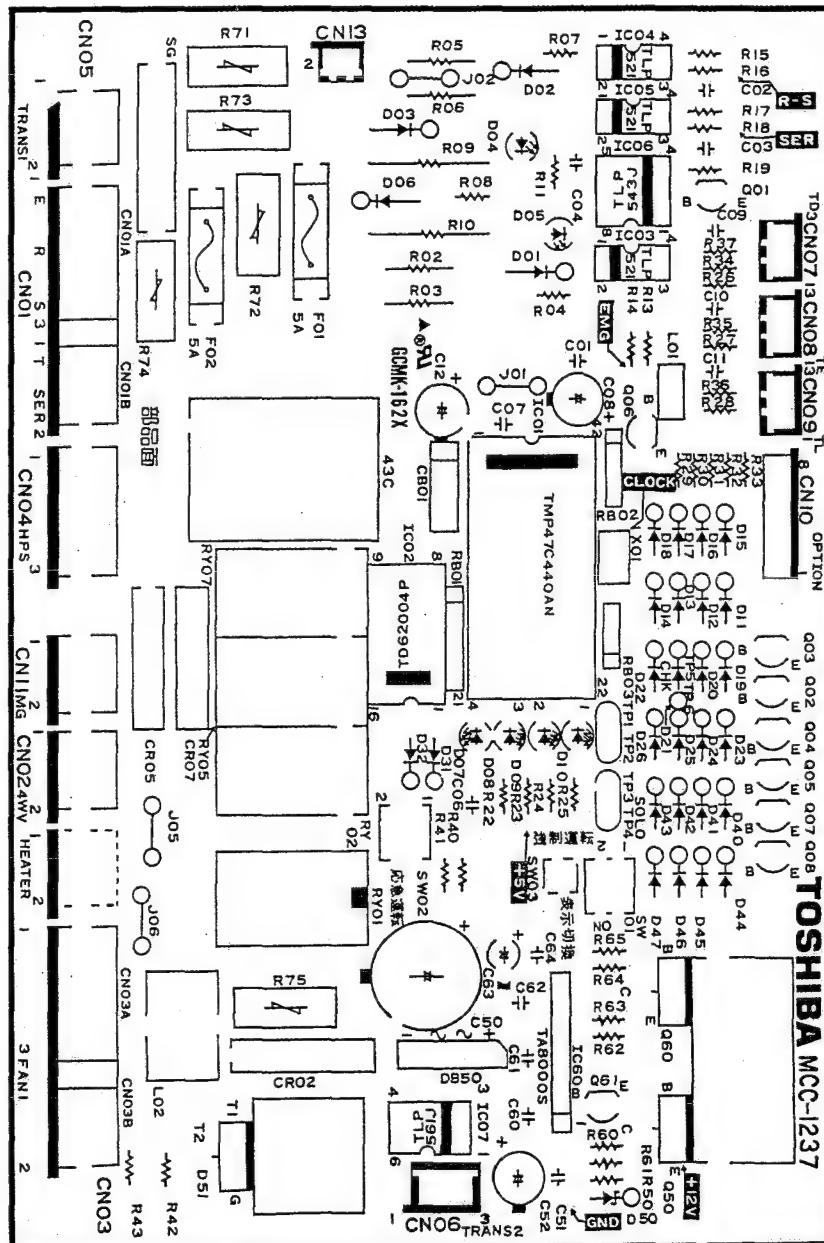

9. DESCRIPTION OF OUTDOOR UNIT CONTROL CIRCUIT

9.1 Outdoor unit control circuit diagram

9.2 Outdoor unit PC board

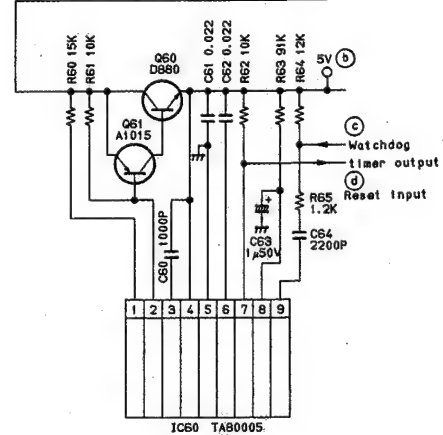

9.3 12V power source circuit

Outdoor PC board produces full-wave rectification by diode bridge (DB50) followed by the provision of transistor (Q50) produces DC power source (Ⓐ) at 12V.

9.4 5V watchdog timer circuit

Basically, the same description as the indoor PC board applies, provided, however, that the reset circuit is not added to the outdoor side.

9.5 Sensor circuit

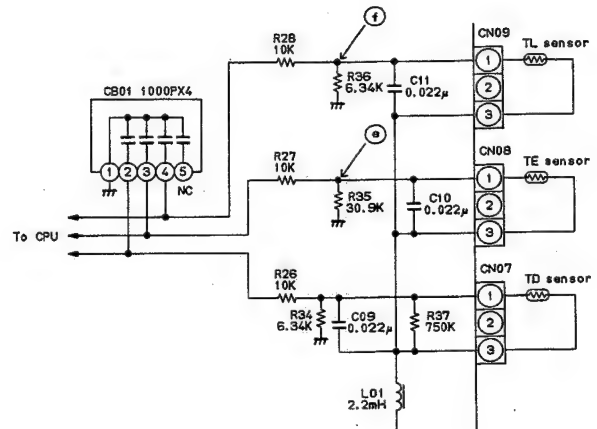

This circuit detects the temperature by dividing voltage with resistance and sensor and bringing the voltage value into CPU, using the characteristics of the sensor that resistance varies with different temperatures.

TE is for defrosting, while TL is for low ambient cooling operation.

The following voltages are produced at each of the temperatures.

	0°C	25°C
TE Ⓔ	2.3V	3.8V
TL Ⓕ	2.3V	3.8V

When Ⓔ/Ⓕ are at GND or 5V, the sensors are either open or short-circuited.

9.6 Serial signal circuit (between indoor and outdoor units)

Transmits and receives the signals between indoor and outdoor units in serial signals. As 230V is used for transmitting the signal, the microcomputer section is insulated with photo-coupler with 5V being supplied.

9.7 Abnormality-detecting circuit

When high pressure switch is operated, abnormality is detected to stop the compressor.

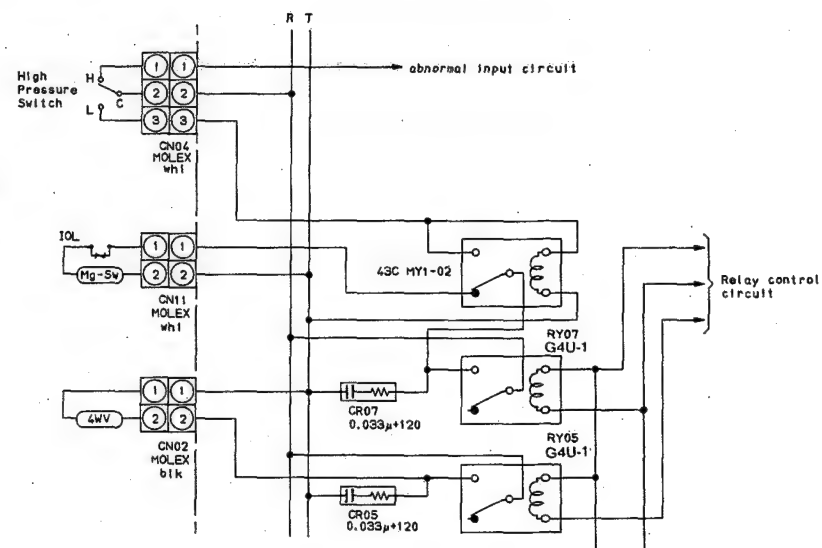

9.8 Relay circuit

The relay circuit consists of the diagram in the righthand side.

RY05 : 4-way valve ON/OFF

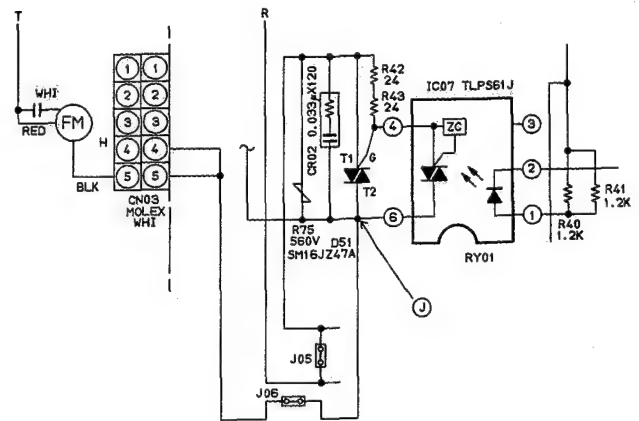

RY07 : Magnetic switch ON/OFF

43C : Self-holding relay used when high pressure switch operates. (Magnetic switch OFF)

9.9 Fan speed control circuit

The fan speeds are controlled by triac IC07. This allows the fan to operate at any one of 16 speeds. This function only occurs when the unit is in the cooling mode, zero waves equates to fan stop.

Waveform obtained between ① and T.
Example shown is for 4 waves.

9.10 Lightning surge protection circuit

The circuit on the right, protects the PCB from damage caused by a lightning surge. Varistors are connected between the live and neutral and live and earth lines to protect against voltage surges.

10. OPERATION OF AIR CONDITIONER FROM OUTDOOR UNIT

It is possible to operate the air conditioner from the outdoor unit using switches provided on the outdoor PCB.

① Set dip-switch (DSW01) bits 1 & 2 to ON position.

② STOP → OPERATION
(orange LED off → orange LED flashing)

Hold push switch (SW03) down for a few seconds until LED D08 (yel) lights. Indoor unit will then start and a few seconds later, outdoor unit will start running.

After a few minutes, LEDs D07, D09 & D10 will light.

 OPERATION → STOP
(orange LED flashing → orange LED off)

Hold push switch (SW03) down for a few seconds. LED D10 will turn off and both units will stop running. LEDs D07, D08 & D09 will be turned off.

③ Reset DSW01 bits 1 & 2 to OFF position for normal operation.

11. EMERGENCY OPERATION

If the air conditioner develops a fault which stops it from operating normally, it is possible to operate the air conditioner using change-over connectors incorporated into the units. In this case, operation of the air conditioner is controlled by switching on and off the power supply. Details of how to change-over the units to operate in the emergency mode are shown below:

- ① Switch off the power supply to the outdoor unit.
- ② Remove the electrical parts cover from the indoor unit. Pull out the connector of R phase (red) lead wire from terminal ① and connect it with the connector of lead wire for fan motor K1 output (red).

Note: If the indoor unit is a cassette model, the float switch connector must be removed from the PCB. Replace the electrical parts cover on the indoor unit. On the outdoor unit PCB, change the switch settings on dip switch DSW02 as follows:

- ③ Switch on the power supply to the outdoor unit.

12. APPLIED CIRCUIT

(1) Display output (PJ13)

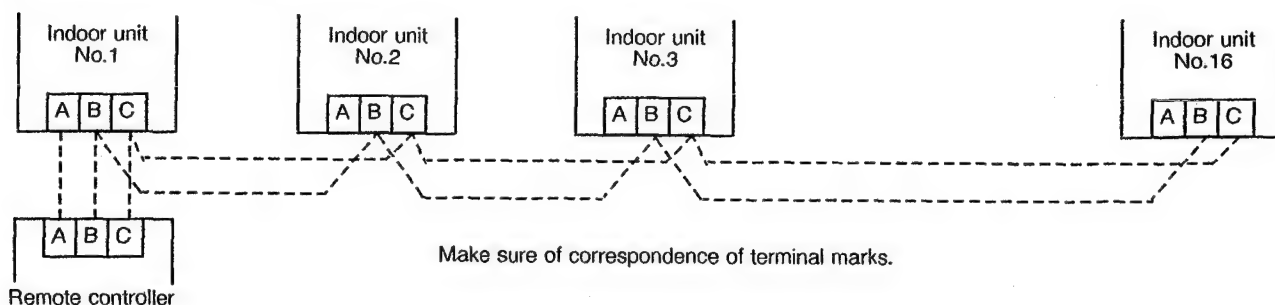

An auxiliary display output circuit (+12V) is available at PJ13 on the Indoor PC Board to display the operation for compressor, operation (Fan only) and abnormality.

13. WIRING FOR GROUP OPERATION

Up to 16 units can be controlled as a group by one remote controller.

- ① Align the phase sequence of the power supply to all outdoor units.
- ② Connect the terminals A, B, C on both of the remote controller and the indoor unit of No.1 unit.
- ③ Connect terminals B, C on both indoor units of No.1 and No.2 unit. Then connect in the same way No.2 and No.3, No.3 and No.4 up to No.16 unit.

- ④ Remove the PJ12-connector on the indoor PC board of No.2 unit and up to No.16 unit to prevent malfunction.

- ⑤ Set each unit No. rotary switch on the indoor PC board. The unit connected to the remote controller should be set as No.1 unit. Then set No.2 and up to No.16 so that start time of each unit is respectively delayed to prevent simultaneous starting current.

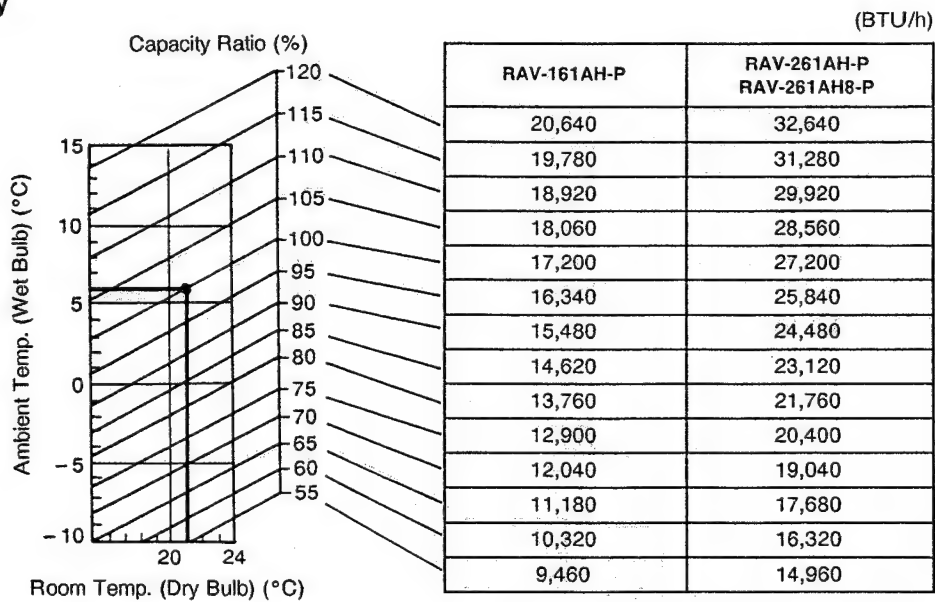

14. PERFORMANCE CHARACTER

Cooling capacity

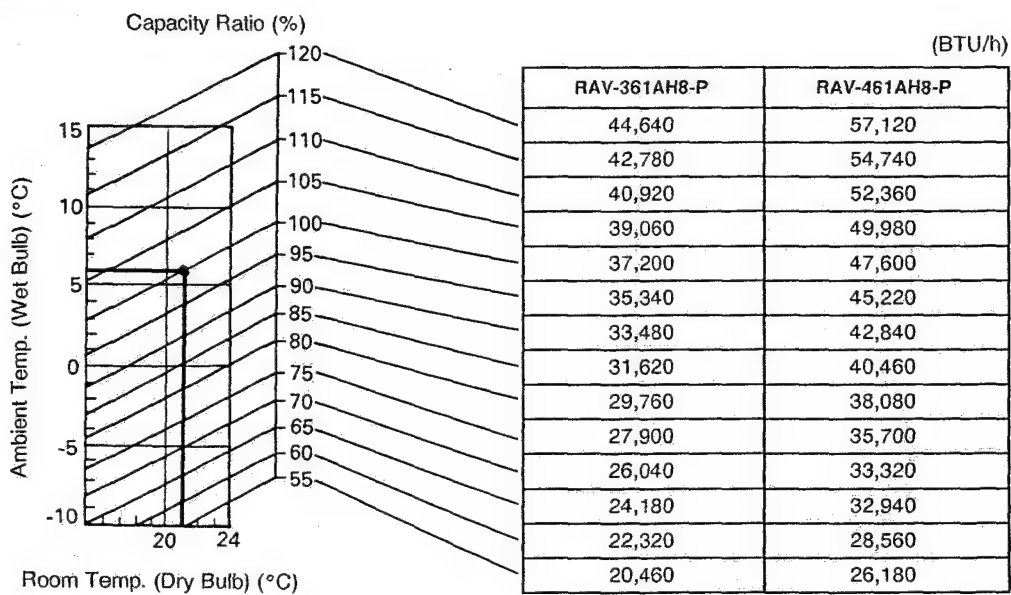

Heating capacity

Cooling capacity

Heating capacity

Piping length/cooling capacity/heating capacity

RAV-161AH-P
RAV-261AH-P
RAV-261AH8-P

RAV-361AH8-P
RAV-461AH8-P

Piping length/additional refrigerant volume

Model (RAV-)	Piping length less than (m)	20	Additional amount of refrigerant at installation site (kg)						Recharge amount of interchange time (kg)									
			25	30	35	40	45	50	5	10	15	20	25	30	35	40	45	50
161AH-P	Filled at factory		0.15	0.35					1.35	1.45	1.5	1.6	1.75	1.95				
261AH-P 261AH8-P			0.3	0.6					2.2	2.25	2.3	2.35	2.65	2.95				
361AH8-P			0.25	0.5	0.75	1.0	1.25	1.5	3.0	3.15	3.15	3.4	3.65	3.9	4.15	4.4	4.65	4.9
461AH8-P			0.25	0.5	0.75	1.0	1.25	1.5	3.6	3.7	3.8	3.9	4.15	4.4	4.65	4.9	5.15	5.4

- The amount of refrigerant put into the outdoor unit at the factory is equivalent to the one that fills up 20m length of refrigerant pipe.
- If the length of refrigerant pipe is 20m or less, addition of refrigerant at the installation site is unnecessary. If the length of the pipe exceeds 20m, add the refrigerant R-22.
- Overcharge or undercharge of refrigerant in the outdoor unit will cause malfunction of the compressor. The prescribed amount of the replenishment of the refrigerant is shown in the table above.
The permissible amount of refrigerant is the prescribed amount $\pm 50g$.
- For RAV-361AH8-P and RAV-461AH8-P, the length of pipe exceeds 30m the size of pipe at the gas side must be raised one rank (eq 19.0 \rightarrow 22.2).
